

2.To Study &Create Presentation Layer using HTML & CSS using visual studio 2019

Certainly! Visual Studio 2019 is a great tool for web development, and it provides a convenient environment for creating HTML and CSS files. Here's a step-by-step guide on how to create a presentation layer using HTML and CSS in Visual Studio 2019:

1.Install Visual Studio 2019: If you haven't already, download and install Visual Studio 2019 from the official Microsoft website.

- 1. Create a New Project:** Open Visual Studio 2019 and create a new project by following these steps:
 - Go to "File" > "New" > "Project..."
 - In the "Create a new project" window, select "Web" from the left sidebar.
 - Choose "ASP.NET Web Application" as the project template.
 - Enter a name for your project and choose a location to save it.
 - Click "Create."
- 2. Choose Web Application Template:** In the "Create a new ASP.NET Core Web Application" window:
 - Select "Empty" template. This will give you a clean slate to build your presentation layer.
- 3. Add HTML and CSS Files:** Right-click on the "wwwroot" folder in the Solution Explorer and select "Add" > "New Folder." Name the folder "css" to store your CSS files.
Right-click on the "css" folder and select "Add" > "New Item..." In the "Add New Item" dialog, select "Web" from the left sidebar and choose "Style Sheet (CSS)" from the available templates. Name the file "styles.css" and click "Add."
Next, right-click on the "wwwroot" folder again and select "Add" > "New Item..." Choose "HTML Page" from the available templates. Name the file "index.html" and click "Add."
- 4. Edit HTML and CSS:**
Double-click on "index.html" to open it in the code editor.

```
<!DOCTYPE html>
<html lang="en">
<head>
  <meta charset="UTF-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <link rel="stylesheet" href="site.css">
  <title>Your Presentation</title>
</head>
<body>
  <header>
    <h1>Your Presentation Title</h1>
  </header>
  <nav>
```

```
        <!-- Navigation links here -->
    </nav>
    <main>
        <!-- Main content here -->
    </main>
    <footer>
        <p>&copy; 2023 Your Name</p>
    </footer>
</body>
</html>
```

Similarly open style.css and add css code

```
/* Reset default margin and padding */
```

```
body, h1, h2, h3, p {
```

```
    margin: 0;
```

```
    padding: 0;
```

```
}
```

```
/* Basic styling */
```

```
body {
```

```
    font-family: Arial, sans-serif;
```

```
    background-color: #f5f5f5;
```

```
}
```

```
header {
```

```
    background-color: #333;
```

```
    color: white;
```

```
    padding: 10px;
```

```
    text-align: center;
```

```
}
```

```
nav {  
  
    background-color: #444;  
  
    color: white;  
  
    padding: 5px;  
  
    text-align: center;  
  
}
```

```
main {  
  
    padding: 20px;  
  
}
```

```
footer {  
  
    background-color: #333;  
  
    color: white;  
  
    text-align: center;  
  
    padding: 10px;  
  
}
```

Link CSS to HTML:

1. In the `<head>` section of your "index.html" file, link the "styles.css" file by adding the following line: `<link rel="stylesheet" href="styles.css">`
- 2.
3. **Preview in Browser:** Right-click on "index.html" in the Solution Explorer and select "View in Browser" to preview your presentation layer in a web browser.
4. **Make Changes and Refine:** Use Visual Studio's code editor to make changes to your HTML and CSS. You can preview the changes by refreshing the browser.
5. **Responsive Design:** To make your presentation layer responsive, you can add CSS media queries to your "styles.css" file. These queries will apply different styles based on the screen size.

Your Presentation Title

Practical 3.To study and create Master page ,user control etc.

Solution:

What is master page?

a master page is a common page whose content are shared by other pages.we can design the layout of the master page so that other pages can share it.we can have common header and footer through master pages.

Output screen:

Step1:open the visual studio 2019

Step 2:take the new project

Step 3:file->new->project->asp.net web application using c#

Step 4:

Step 5:

Step 6:-right click on mymaster->add->new item->web->webforms->web forms master page->site1.master->add

You will see your master page got inserted

Step 7: now design the layout of the master page

Go to design tab->click on content place holder->table->insert table->4rows,1column->ok->resize the rows->first row act as header(prachi jain classes)->adjust all rows according to output.

Step7:color the row for that set the table then press control button->select row n give green color->second row give yellow color->fourth row yellow color

Coloring done

Step 8:select the table and go to border property:->if not seen then select table tag from source then set border property as 1

Step9:insert the table in row one and text property as prachi jain classes and set size property from property window as 45 and align as centre from menu bar

Step 10:declare or put 4 hyperlink control in row 2 and then set text property as home,,about services,contact us

Step10:in last row row 4 type directly website created and design by prachi jain

*Step 11:now your designing done but most important your content place holder should be in row 3rd means in middle dat means ur header footer should be constant with in whole pages with in website for dat

- go to source page of master page dat is site1.master and check ur contenet place holder which is near by head section cut from der and place it here

```
<td class="auto-style4"><asp:ContentPlaceHolder ID="ContentPlaceHolder1" runat="server"></asp:ContentPlaceHolder>
```

Site1.master:

```

        <td class="auto-style4"><asp:ContentPlaceHolder
ID="ContentPlaceHolder1" runat="server">
        </asp:ContentPlaceHolder>

    </td>

    </tr>
    <tr>
        <td class="auto-style5">
            <asp:Label ID="Label12" runat="server" Text="website
creator and design by prachi jain"></asp:Label>
        </td>
    </tr>
</table>

</div>
</form>
</body>
</html>

```

Step 12: now we have to add other web forms with master page for that

Right click on mymaster->add->new item->web form with master page->name: homepage->add

Step 13: as u will click add button another window will open select a master page

Select site1.master->okk

Step 14: add data in home page in design window as show below

Source file of home page:

```

<%@ Page Title="" Language="C#" MasterPageFile="~/Site1.Master" AutoEventWireup="true"
CodeBehind="home.aspx.cs" Inherits="mymaster.home" %>
<asp:Content ID="Content1" ContentPlaceHolderID="ContentPlaceHolder1" runat="server">
    <p>
        welcome to prachi jain classes</p>
</asp:Content>

```

Step 15: now we have to add other web forms again with master page for that

Right click on mymaster->add->new item->web form with master page->name:about us->add

Step 16:as u will click add button another window will open select a master page

Select site1.master->okk

Step17.add data in about us. in design window as show below

Code for about us window:

```
<%@ Page Title="" Language="C#" MasterPageFile="~/Site1.Master" AutoEventWireup="true"
CodeBehind="aboutus.aspx.cs" Inherits="mymaster.aboutus" %>
<asp:Content ID="Content1" ContentPlaceHolderID="ContentPlaceholder1" runat="server">
    <p>
        we r offering u many web technologies</p>
</asp:Content>
```

Step 18:now we have to add other web forms again with master page for that

Right click on mymaster->add->new item->web form with master page->name:services->add

Step 19:as u will click add button another window will open select a master page

Select site1.master->okk

Step20:add data in services in design window as show below

```
<%@ Page Title="" Language="C#" MasterPageFile="~/Site1.Master" AutoEventWireup="true"
CodeBehind="services.aspx.cs" Inherits="mymaster.services" %>
<asp:Content ID="Content1" ContentPlaceHolderID="ContentPlaceHolder1" runat="server">
    <p>
        we offered teaching services free to students</p>
</asp:Content>
```

Step 21: now we have to add other web forms again with master page for that

Right click on mymaster->add->new item->web form with master page->name:contact us->add

Step 22: as u will click add button another window will open select a master page

Select site1.master->okk

Step 23: add data in contact us in design window as show below

```
<%@ Page Title="" Language="C#" MasterPageFile="~/Site1.Master" AutoEventWireup="true"
CodeBehind="contactus.aspx.cs" Inherits="mymaster.contactus" %>
<asp:Content ID="Content1" ContentPlaceHolderID="ContentPlaceHolder1" runat="server">
    <p>
        call us on 7972555034</p>
</asp:Content>
```

Step 24: now we completed our four pages and they combined with master page

Step 25: now go to the master page and click on home tab(home hyper link tag)->navigation url property from property window->link the pages ->all tabs link one by one

Step 26: -save everything properly

Step 27: run the master page

Navigation to webpages.

Navigation:

Step1:create new project->file->new->empty etc

Step2:project name Navigatio

Step3:right click on navigation->select add->newfolder->give it name images->copy two png in images older

Step4:-right click on navigation->add web form->name:index.aspx->ok-><title>Home</title>

Step5:-right click on navigation->add web form->name:page02.aspx->ok
-><title>page02</title>

Step6:right click on index page->set as start page

Step7:go to design page of index.aspx->write Home->enter->take linkbutton->go to page01
->size->larger->id->lbtnGotopage01->backcolor->green->border->orange->borderstyle
->outset->text->gotopage01

index page

How to Use validation control in Asp.net

Step 1: open visual studio 2019

Step 2: file->new->website->asp.net web application->asp.net web application(.net framework)->next->empty website->add->ok.

Step 3: in solution explorer->right click on new validation form->add->new item->webform

Step 4: now click on design->

Step 5: first we have add a table

Goto toolbox->click on HTML tab->table->click on it

Step 6:->adjust ur table->add row->select row->right click->insert row below->n design ur form accrding to image given below

Step 7: Name:
